# Arduino - Display

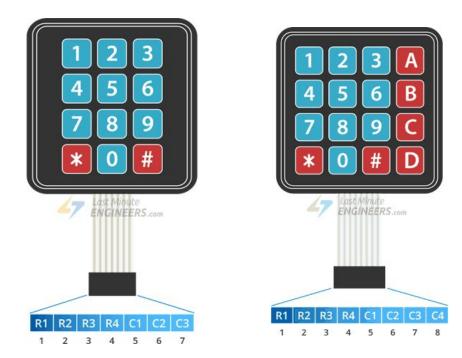

#### Keypad

Membrane keypads come in a variety of sizes, the most common of which are the 4×3 keypad (12 keys) and the 4×4 keypad (16 keys). They have a layout similar to that of a standard telephone keypad, making them

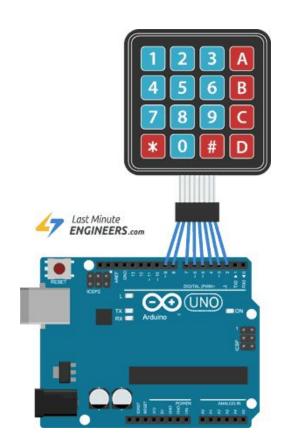

easy to use for anyone.

The keypad has a female Dupont connector. When looking at the front of the keypad, the row pins are on the left, and they usually have a dark strip near the connector to help identify them. The pinouts are as follows:

# Wiring Arduino

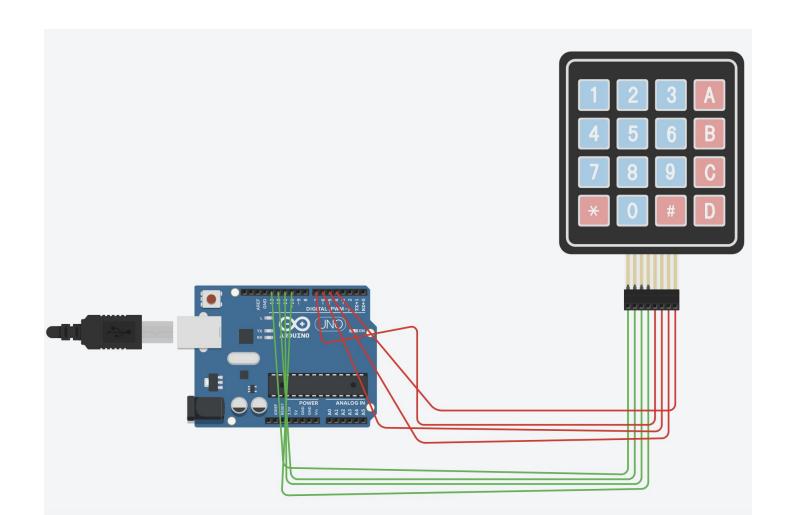

## Installing Keypad Library

To determine which key was pressed, we must continuously scan rows and columns. Fortunately, Keypad.h was written to abstract away this unnecessary complexity.

To install the library, navigate to Sketch > Include Library > Manage Libraries.

#### Code example

```
#include <Keypad.h>
const int ROW NUM = 4; //four rows
const int COLUMN NUM = 4; //three columns
char keys[ROW NUM] [COLUMN NUM] = {
 {'1','2','3', 'A'},
 {'4','5','6', 'B'},
  {'7','8','9', 'C'},
  {'*','0','#', 'D'}
};
byte pin rows[ROW NUM] = {13, 12, 11, 10}; //connect to the row pinouts (R1,R2,R3,R4) of the keypad
byte pin column[COLUMN NUM] = {7, 6, 5, 4}; //connect to the column pinouts (C1,C2,C3,C4) of the keypad
//any arduino pin is alright
Keypad keypad = Keypad( makeKeymap(keys), pin rows, pin column, ROW NUM, COLUMN NUM);
void setup(){
  Serial.begin(9600);
void loop(){
  char key = keypad.getKey();
  if (kev) {
    Serial.println(key);
```

#### LCD

Outputs individual ASCII characters with fixed size.

We can notice that there are small rectangular areas composed of 5×8 pixels grid
