*"Charlie, did you really get these details
from the customer?"*

BPM Lifecycle

Introduction

Process identification systematically defines business processes of a company and establishes clear criteria for prioritizing them.

Process Identification

- **Output:** process architecture
- **Purpose:** to guide modeling and automation

Focus only on Key Processes

- BPM is not free
- Too expensive to monitor every single process
- Resources are limited

What is a Key Process?

- Strategically important for the survival or future of the business
- Represents significant operational dysfunction
- Could change over time

Why could it change?

- Problems get fixed
- Market demands change
- Regulatory environment changes
- New competitors

Discussion: Identify Key Process

Process Identification has Two Phases

- **Designation** - understand processes and inter-relationships
- **Evaluation** - prioritize

Phase 1: Designation

Designation Phase

- Identify existing processes
- Understand interrelationships
- Avoid coarse-grained views

Porter's Value Chain Model

- 
- Core Processes
 - Support Processes
 - Management Processes

**Management
Processes**

Strategic Planning

Risk Management

**Core
Processes**

Loan Processing

Account Management

**Supporting
Processes**

IT Support

HR

Facilities Management

OUTCOME

Broad vs. Narrow Processes

- Broad: high impact, low manageability
- Narrow: low impact, high manageability

Importance of Mapping Relationships

- Understand dependencies
- Prepare for redesign
- Avoid disruptions

Reference Models for Identification

- ITIL
- SCOR
- APQC PCF
- VRM
- Rummler-Broche

Discussion: Apply to UNR

Phase 2: Evaluation

Evaluation Criteria – Importance

- Strategic relevance
- Alignment with goals

Evaluation Criteria – Dysfunction

- Identify troubled processes
- Use feedback

Evaluation Criteria – Feasibility

- Cultural readiness
- Likelihood of success

BPM Maturity Assessment: CMMI Maturity Levels

- 
- Level 1: Initial
 - Level 2: Managed
 - Level 3: Defined
 - Level 4: Quantitatively Managed
 - Level 5: Optimizing

Balancing Evaluation Outcomes

- Strategic importance vs. feasibility
- Start with manageable improvements

Process Architecture

Process Architecture: Levels of Details

Designing a Process Architecture

- Conceptual model
- Consumer-producer relationships
- Levels of detail

Case Type and Function Dimensions

- Case Type: what is handled
- Function: what is done

Identifying Case Types

- Product/service type
- Channel
- Customer type

Case/Function Matrix

- Columns: Case types
- Rows: Functions
- Cells: applicable combinations

Example: Harbor Authority Process Architecture

			case type			
			Sea	Road	Rail	Inland
business function	pre-arrival	notify ETA	Inbound Planning			
		notify authorities				
		reserve tow-boat				
	arrival		Inbound Handling			
	trans-shipment	stacking/handling		Outbound Handling		
		payment				
	departure	infrastructure info				
		notify ETD				

Alternate Architectural Representations

- Lead, Service, Support
- Input, Guide, Output, Enabler (IGOE) model
